

ASP FACTS

FEATURE: Heat Treated Keys

ADVANTAGE:

Most handcuff keys are stamped from mild steel. As a result, they twist off easily in handcuffs. They also break when subjected to lateral pressure by a resisting subject. ASP heat treated handcuff keys are corrosion resistant and extremely durable.

SPECIFICATION:

- Hammer forged construction
- Precision machined
- Heat treated for strength
- Extended key design
- Increased yield strength
- Increased tensile strength
- Corrosion resistant

PERFORMANCE:

ASP Extended Handcuff Keys are easier to use on a handcuffed subject than traditional keys. They are extremely strong. The keys will not break from lateral pressure. They will not twist off in a lock. Their construction makes them corrosion resistant.

SALES STRATEGY:

Using the ASP Test Block, demonstrate the ease with which traditional handcuff keys break when lateral pressure is applied to them. Demonstrate the strength of ASP Handcuff Keys.
